Cybernetix enhances its offer of Mooring Line Load Monitoring Systems with a new contract award

September 2010 – The Angolan subsidiary of a major oil company operating in West Africa, selects Cybernetix for the procurement of new Asset Integrity Monitoring systems and associated services. This contract will be carried out by Cybernetix, and its partner Principia for the data processing and data interpretation parts.

The purpose is to monitor the mooring lines of a FPSO in real time. The solution was custom-made for this project. As such it becomes a lighter version of the ALLMS, the successful Anchor Leg Load Monitoring System, designed and developed by Cybernetix. The ALLMS is currently in operation on FRADE field (Brazil) and is about to be deployed on SKARV FPSO (Norway).

This new technological solution answers three key objectives: reliable and economical instrumentation, continuous measurement of parameters and daily transmission of data.

The integrity monitoring of offshore assets and facilities for oil & gas complex and/or deepwater or ultra deepwater applications is a rapidly expanding market. For such hostile environments Cybernetix can provide a full range of field-proven equipments renowned for their efficiency and reliability in extreme conditions, where human intervention is impossible.

About Cybernetix

Cybernetix is a leading provider of remotely operated or robotic systems for interventions in hostile environments. The group operates in two main markets : Energies – Oil & Gas, nuclear – for the mother company Cybernetix SA, and non destructive testing for Industries (via CyXplus subsidiary). Cybernetix counts 145 employees and has developed a world-class engineering and services expertise in project management, and integration of global solutions, operating in 15 countries.
