

## LightOn launches a sovereign SaaS offering to simplify enterprise integration of document AI

Paris, 2 June 2026

**LightOn, a leading French provider of secure AI for sensitive data, announces LightOn Console, its open-access platform for developers and independent software vendors (ISVs). With this software infrastructure, LightOn provides organizations with an API that enables them to deploy a ready-to-use, sovereign, and flexible data search and analysis engine in minutes.**

"AI agents, intelligent virtual assistants capable of automating complex tasks, are being deployed at scale across enterprises," said **Igor Carron, CEO and co-founder of LightOn**. "To be effective, however, they need to access and understand an organization's internal documents so they can ground their responses. Until now, companies faced a dilemma: build a custom search system themselves at significant cost, or entrust their confidential data to U.S. technology giants. With LightOn Console, we now offer them a third option."

### Simple technology building blocks to replace months of development

LightOn simplifies work for technical teams. With LightOn Console, developers gain direct access to three ready-to-integrate connection building blocks, or API endpoints:

- **/parse:** reads, decodes, and automatically structures all types of documents, including complex formats such as tables, forms and scanned PDFs. Powered by [LightOnOCR-2](#), a state-of-the-art model created by LightOn.
- **/extract:** identifies and extracts key information instantly from large volumes of data and non-standardized documents.
- **/search:** a semantic search tool that enables AI to retrieve information intelligently, far beyond simple keyword matching. /search is based on the [LateOn and DenseOn](#) models.

This architecture relies on advanced analysis technologies developed by LightOn while remaining fully compatible with market standards.

### Built-in sovereignty

With LightOn Console, LightOn aims to become the reference document search infrastructure for production AI applications in Europe, compatible with the main models on the market and sovereign.

With this self-service launch, LightOn is making available to all developers the industrial technology that previously powered LightOn's custom projects. This software infrastructure is already used daily by major public-sector organizations and large industrial groups, including Région Île-de-France, AFNIC, Infocom'94, Orange Business, Sodern and Europrop International.

Developers and software vendors building AI products can now access, in minutes, the same technology used by organizations with strict security and compliance requirements.

## A transparent billing model

With LightOn Console, the two offerings move away from the opaque pricing models used by major market players:

- The API offering is based on a free license and billing tied to actual usage volume.
- The Business offering is based on a paid license and billing tied to actual usage volume.

Companies can test the tools free of charge in a secure trial environment, with no commitment, and choose the offering that best meets their needs.
